

Shakir Hossain | [LinkedIn](#) | [github](#)

An experienced Business System Analyst with over 5 years of hands-on experience designing and implementing database solutions, and large-scale migrations on modern data platforms. I collaborate with stakeholders, project managers, and technical teams to support cloud-based system initiatives. Motivated by opportunities to streamline processes and innovate within enterprise ecosystems.

Skills

Proficient: Python, Linux/Bash, RDBMS/SQL, Agile/Scrum, Git, Docker, MS Word, MS Excel

Competent: Java, PySpark, Pandas, Dbt, Airflow, Scala, Databricks, YAML, Tableau, PowerBi, Kafka

Familiar: Azure DevOps, Azure Data Factory, Snowflake, Hadoop, Ubuntu, MSSQL, AWS

Education

Dalhousie University (2018-2021), bachelor's in computer science, Faculty of Computer Science

Saint Mary's University (2016-2018), Diploma of Electrical Engineering, Faculty of Engineering

Professional Experiences

Business System Analyst, Jarvis Consulting (2025-2026): Led Requirement Analysis for CIBC clientele in need of modernizing 577 legacy DataStage and SAS ETL applications. Elicited requirements to preserve the functional equivalence, governance compliance, and seamless downstream integration of the applications that serve over 15 million clients globally. Completed SRD & IRD documentations to capture end-to-end flow specifications for all interfaces tracing down to the Business Requirements. Ensured traceability between documented solution requirements and Test strategy document produced by QA team across SIT, UAT, and PAT test stages. Provided functional scope for test case creation and test data definition, ensuring business requirements were accurately reflected in UAT test scenarios. Produced mapping specifications for 500+ data fields by drafting data mapping documentations, contributing to 95% defect resolution pre-release. Ensured seamless source file integration into the Azure cloud EDGE platform, preserving legacy formats, schedules and controls without disruptions. Delivered knowledge transfer and documentation that reduced post-handover dependency by ~40%.

Solutions Developer, Emera Energy (2021-2025): The organization relied on legacy on-premises SQL Server infrastructure running on Windows Server 2008 R2, leading to high maintenance overhead and scalability limitations. Designed and executed MSSQL and MySQL migrations from on-premises environments to Azure SQL Services and built end-to-end proof-of-concept ETL pipelines using Azure Data Factory to validate Azure PaaS solutions against legacy tools like SSIS and linked servers. Successfully decommissioned outdated infrastructure, reduced maintenance costs, and demonstrated the viability and benefits of Azure PaaS-based data integration. Gained deep experience in cloud database migrations and learned how modern PaaS ETL tools can simplify architecture, improve scalability, and replace legacy frameworks effectively.

Software Developer, LED Roadway LTD (2019-2020): The company needed an accessible way to monitor the geo-location and performance of streetlamp microsensors in real time. Developed an Android application that integrated sensor performance and location data and built a geographical user interface using the OpenStreetMap API to display live data feeds and sensor locations. Improved accessibility and visibility of sensor data, enabling users to monitor streetlamp performance and locations efficiently through a mobile interface. Gained experience in mobile app development, real-time data integration, and building map-based user interfaces to enhance usability and operational monitoring.

Projects

Project source code: https://github.com/jarviscanada/jarvis_data_eng_ShakirHossain

Databricks Analytics Project: The existing data solution struggled to scale efficiently with growing data volumes and processing demands. Redesigned the data architecture using Apache Spark within a Databricks workspace to enable distributed, multi-node data processing. Achieved scalable big data processing with improved performance, reliability, and faster data pipelines. Gained hands-on experience in designing and operating distributed data solutions and learned how cluster-based processing significantly improves scalability and throughput.
